

1. Based on the user feedback from my prototype testing, users expressed a desire for a **group chat feature**. This feature would automatically create a group chat for users who are on the same flight (for example, from Brisbane to Tokyo). In this group chat, users can connect with fellow passengers, share information, and find suitable travel companions. This would enhance the social aspect of the app, allowing users to interact with others traveling on the same journey.

2. Allow users to create and join events or meetups at their destination (e.g., "Explore Tokyo Nightlife" or "Group Tour to Mount Fuji"). This can enhance social connections and help travelers find companions for specific activities.

3. Real-Time Flight Chatroom

Create a real-time flight chatroom where users on the same flight can discuss updates, delays, or make plans during layovers. This is particularly helpful for fostering communication and coordination in real-time.

4. Travel Challenges and Rewards

Gamify the app by introducing travel challenges (e.g., visiting certain landmarks, trying local foods) and reward users with badges, points, or special offers, encouraging more interaction and exploration.
